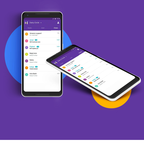
Case Study

helpchat

Mobile Product App



Problem statement

We are trying to solve the issue of the users who have to keep a lot of apps in their device for each tasks inturn reducing the phone memory and storage

Mobile Product App

Meet, helpchat

Helpchat is built to help people get more things done. It likes to believe that is in the business of restoring balance in the battle between people and tasks.

Helpchat tries to provide a powerful solution to this.

User group: Main target users are aged between 15 to 40 who use their smart phone for their daily commute and tasks. So basically who are tch savy and are familiar with th digital world

01

The Task

I was tasked to create a world-class mobile app that would meet the need and expectations of large user group and make their day to day work load easier and less time consuming. Main tasks includes:

- I was tasked to creat the branding and the design system for the applications.

- Perform user research workshops where interviews were carried out on real users.

- Also maintain a bridge between the design team and the development team.

02

Discovery phase

Started with a discovery phase that included deep thinking to identify our unique business value and product features, our customer archetypes, product funnel and took a look at best-in-class experiences in the space.

I took our learnings from that and crafted a UX strategy and app experience that met business needs with the customer desires and amazing fan-driven experience.

03

Storyboarding & User flows

Storyboard where created for each scenario we expect the users to travel through, to explore what all features and help they need, the painpoints they face during each scenarios.

Why: This helped us to understand a real-time experience of the user scenarios and the problems they are facing.

Hand drawn sketches where created for user testing and also feature preservation to the stakeholders.

Why: This helped in time management and changes were easily made to the sketches and rebreated screens were used for vigorus user testing by real time users.

04

Demo-first Approach

Allowed fans to experience the app risk-free with a real demo allowing them to see first-hand how it works and experience the fun and excitement.

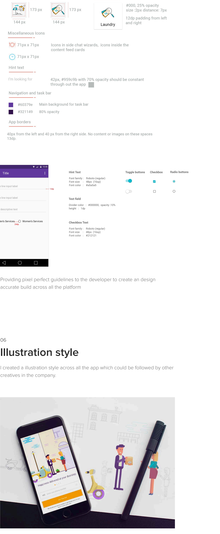
Why: With the demo-first approach, we were able to leverage this feature as a tool for stronger acquisition - driving sign-ups and extending daily usage by understanding the product, offering, and benefits first-hand.

Wanted to get the app into the public asap so that we can learn and get feedbacks and act according to it.

05

Creating Brand Identity

I established a library of design elements that formed the basis for our design system that could be used throughout the site to rapidly create pages and build content and support future app growth needs. From modular components to atom-level design elements, the design system supports the engineering and future design team wit rapid and harmonious creation.



Providing pixel perfect guidelines to the developer to create an design accurate build across all the platform

06

Illustration style

I created a illustration style across all the app which could be followed by other creatives in the company.

07

Interactive Prototype

Build an interactive prototype of the experience we were designing early eand updated it along the way to enable our teams to present to the investors and boards. The touchable prototype was shared on their mobile device and enabled ourself to secure the funding to continue the development and release the product to the market.

08

Final Outcome

The first phase of the app was launched September, 2015. There was a huge rush in the download number even though it was beta version. These user helped us understand our real time users and their expectation and release and research before launching new features.

Product reviews and interviews were carried out each weekend using tappable prototypes with real time user.

After 1 and half year of successfull release the app was acquired by Amazon for an undisclosed fee
